

Abstract: The purpose of this study was to investigate the effect of the type of the stimulus on the response time of the subjects. The subjects were divided into two groups: the first group was the control group and the second group was the experimental group. The control group was given a visual stimulus and the experimental group was given an auditory stimulus. The results showed that the response time of the subjects in the experimental group was significantly shorter than the response time of the subjects in the control group. This indicates that the type of the stimulus has a significant effect on the response time of the subjects.
